cov mats are nonneg def

X full rank for  $\hat{\beta}$  unique

posdef if  $min(\lambda_i) > 0$ 

E(rand mat)=mat of E

$$Cov(Y) = E[(Y - \mu)(Y - \mu)'] = \Sigma$$

$$\begin{vmatrix} \sigma_{11} & \sigma_{12} & \cdots & \sigma_{1n} \\ \sigma_{21} & \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots & \vdots \\ \sigma_{n1} & \cdots & \cdots & \sigma_{nn} \end{vmatrix}$$

where  $\sigma_{ij} = E[(Y_i - \mu_i)(Y_j - \mu_j)']$  $Cov(AY + b) = ACov(Y)A' = A\Sigma A'$ 

 $Cov(W, Y) = E[(W - \gamma)(Y - \mu)']$ 

 $MVN \Sigma pos def$ 

1) lin trans of mvn yields mvn.

If  $X \sim N_n(\mu, \Sigma)$  and Y = AX + b

with  $A_{r\times n}$  matrix of constants and  $b_{r\times 1}$  vector of constants.

Then  $Y \sim N_r(A\mu + b, A\Sigma A')$ 

2) **lin combin** of ind mvns is mvn

 $X_1, \ldots, X_k$  iid  $X_i \sim N_n(\mu_i, \Sigma_i)$ 

Let  $Y = a_1 X_1 + \cdots + a_k X_k$ 

Then  $Y \sim N(\mu^*, \Sigma^*)$  where  $\mu^* = \sum_{i=1}^k a_i \mu_i$  and  $\Sigma^* = \sum_{i=1}^k a_i^2 \Sigma_i$ 

3) Marginals of mvn are mvn

If  $X \sim N_n(\mu, \Sigma)$ 

Partition:  $X = \begin{pmatrix} X_1 \\ X_2 \end{pmatrix}$  where  $X_1$  is  $r \times 1$  and  $X_2$ 

 $\mu = \begin{pmatrix} \mu_1 \\ \mu_2 \end{pmatrix}$  where  $\mu_1$  is  $r \times 1$  and  $\mu_2$  is  $(n-r) \times 1$  $\Sigma = \begin{vmatrix} \Sigma_{11} & \Sigma_{12} \\ \Sigma_{21} & \Sigma_{22} \end{vmatrix}$ 

where  $\Sigma_{11}$  is  $r \times r$ ,  $\Sigma_{21}$  is  $(n-r) \times r$  and  $\Sigma_{22}$ is  $(n-r) \times (n-r)$ 

Marginals:  $X_1 \sim N_r(\mu_1, \Sigma_{11})$ 

 $X_2 \sim N_{(n-r)}(\mu_2, \Sigma_{22})$ 

4) Conditionals of mvn are mvn. Suppose  $X \sim N_n(\mu, \Sigma)$ 

Partition same way

 $X_1|X_2 = x_2 \sim N_r(\mu_1 + \Sigma_{12}\Sigma_{22}^{-1}(x_2 - \mu_2), \Sigma^*)$ 

where  $\Sigma^* = \Sigma_{11} - \Sigma_{12}\Sigma_{22}^{-1}\Sigma_{21}^{-1}$ 

Estimable, Testable

If X is full rank, any (nonzero) C gives estimable  $\boldsymbol{\theta}$ 

rank(X) = rank(X'X) = number of estimableparameters, and for  $\hat{\theta} = C\beta$ , check estimability.

If X full rank then  $\theta$  is testable  $\Leftrightarrow$ C is full rank a or M is full rank a (because any  $\theta$  is estimable)

T-tests

One-sided Test (only for scalar hypothesis)  $F_{obs}(1, n-r) = tval^2(n-r)$  $H_A: \theta < \theta_0 \text{ Uses } \alpha H_A: \theta > \theta_0 \text{ uses } (1-\alpha)$ Two-sided  $H_A: \theta \neq \theta_0$  uses  $\alpha/2$  and  $(1-\alpha/2)$ In all cases reject  $H_0$  if |test stat| > |crit value|

F-tests

Reject  $H_0$  if  $f_{obs} > f_{crit}$ Two-sided uses  $\alpha$  crit value One-sided  $\theta < \theta_0$  uses  $2\alpha$  and requires appropriate sign of difference All linear model GLH tests correspond to

comparing two models, the "full" model,  $y = X\beta + \epsilon$  and a reduced model defined by

constraints For a single coefficient  $\beta_i$  we can test

 $H_0: \beta_j = 0$  if  $\beta_j$  is estimable

$$t = \frac{\hat{\beta}_j - 0}{\sqrt{var(\hat{\beta}_j)}}$$

Obtain estimate  $\hat{\sigma}^2 = MSE$ 

if know  $\sigma^2$  then  $t \sim N(0,1)$ 

if estimate  $\sigma^2$  from data then  $t \sim t_{dfE}$ 

Sum of Squares Decomp
